Na tabla periodica que es

Que es na de la tabla periodica. Que es el na en la tabla periodica. Que elemento es na en la tabla periodica. Que es na en la tabla periodica de los elementos. Que es el simbolo na en la tabla periodica.

sodium atomic number 11 Valencia 1 oxidation statest +1 Electronegativity 0.9 Covalent radii [Å] 1.54 ionic radii [Å] 0.95 Atoic radii [Å] 1.90 Electronic configuration [NE] 3S1 First ionization potential (eV) 5.14 Massa At (g / MOL) 22,9898 Densitáf (g / ml) 97 Boiling point (°A) 892 Melting point (°A) 97.8 SIR HUMPHREY DAVY discoverer in 1807 chemical element, na symbol, atomic number 11 and atomic weight 22. The 9898. It is a soft, reactive metal and low fusion point, with a relative density of 0.97 to 20A°C (68A). Or. From a commercial point of view, sodium is the most abundant of all the elements of the terrestrial crust, which contains 2.83% sodium in its combined shapes. The sodium is, after chlorine, the second element most abundant in solution in sea water. Important ¡at! sodium salts that are in nature are sodium chloride (rocky salt), sodium carbonate (soda and trona), sodium body (brace), sodium nitrate (Chilean nitrate) and Sodium sulfate. Sodium salts are located in sea water, in salted lakes, alkaline lakes and mineral sources. Sodium reacts violently with water, even with snow, and even with cold water to produce sodium hydroxide. When exposed to the air, the newly cut metallic sodium loses its silver appearance and becomes an opaque gray forming a sodium oxide coating. Sodium does not react with nitrogen, even at very high temperatures, but can react with ammonia to form sodiam amide. The sodium reacts with hydrogen peroxide to form sodium superoxide. Sodium hardly reacts with carbon, if it never reacts, but does only with halogens. Reacts also with different metal halides to give metal and chloride of Sodium does not react with paraffin hydrocarbons, but it is composed of addition with naphthalene and other polycyclic aromatic compounds and with aryl alkenes. The reaction of sodium with alcohol is similar to the reaction of sodium with water, but less rapid. There are two general reactions with organic halogens. One of these requires the condensation of two organic compounds containing halogens during their removal. The second type of reaction includes the substitution of hydrogen with sodium to obtain an organosodium compound. Sodium effects on health Sodium is a component of many foods, for example common salt. It is necessary for humans to maintain the balance of physical fluid systems. Sodium is also necessary for the functioning of nerves and muscles. An excess of sodium can damage our kidneys and increase the chances of hypertension. Sodium contact with water, including sweating, causes the formation of sodium hydroxide fumes that are highly irritating to the skin, eyes, nose and throat. This can cause sneezing and coughing. Very serious exposures can cause respiratory difficulties, cough and chemical bronchitis. Contact with the skin can cause itching, tingling, thermal and caustic burns and permanent damage. Sodium reacts with acids to produce hydrogen gas (free hydrogen) and sodium salt (from the acid). 88 mg/48L (tap water). Environmental degradation. This chemical is not mobile in its solid form, even if it absorbs moisture very easily. Once liquid, sodium hydroxide rapidly enters into the soil, with the possibility of contaminating water reserves. Reference page. Sodium risk in irrigation Sodium and its presence in water Return to 575 Suncoast Drive South Miami, FL 33143 USA Phone: + 877 455 8095 e-mail: info@lenntech.com Level 5 - OFFICE 358-ONE JLTJ Tower Juneirah Lake Towers Dubai - U.A.E.
